Week 1: Process Networks

Logistics

Class web page:

http://embedded.eecs.berkeley.edu/concurrency

Project

Paper (and paper review)

Homework

Reading

Technology:

- Ptolemy II
- Java
- Eclipse
- LaTeX

Homework

- o Issued roughly every two weeks
- o Will leverage a common technology base:
 - Java
 - Eclipse
 - Ptolemy II
- o First assignment is on the web

Lee 01: 3

Project

- o Conference (workshop) paper quality expected
- o Papers will be "submitted" and "reviewed" by you
- o Presentations will be workshop like
- o Teams up to two are encouraged
- Leveraging the technology base is encouraged
- Many project suggestions are on the web
 - In almost all cases, I have a fairly clear idea of how to start. Come talk to me if one of these looks interesting

Introduction to Edward A. Lee

- Working in embedded software since 1978, when I was writing assembly code for 8-bit microcontrollers to control biomedical robotic machines. From 1980-82, I was writing assembly code for the AT&T DSP-1 to implement modems at Bell Labs.
- BS '79 (Yale, Double major: CS and EE)
 SM '81 (MIT, EECS)
 PhD '86 (Berkeley, EECS)
- o Berkeley EECS faculty since 1986
- One of four directors of Chess, the Berkeley Center for Hybrid and Embedded Software Systems
- o Director of the Berkeley Ptolemy project
- Co-author of nine books (on embedded systems, digital communications, signals and systems, dataflow)
- o Chair of EE, then EECS, from Jan. 2005- June 2008.
- o Co-founder of BDTI, Inc., a 19 year old technology company

Lee 01: 5

Who are you?

Model of Computation

NIST:

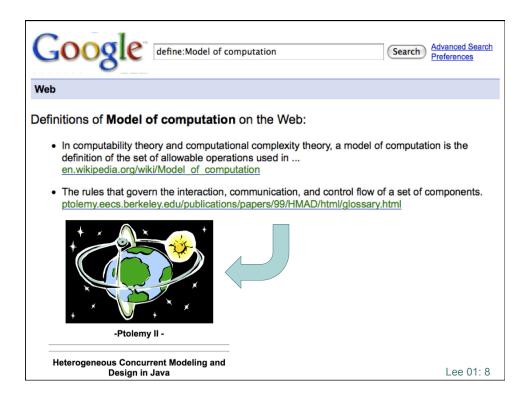

"A formal, abstract definition of a computer."

Examples: Turing machine, random access machine, primitive recursive, cellular automaton, finite state machine, ...

Wikipedia (on 1/18/09):

"the definition of the set of allowable operations used in computation and their respective costs."

"In model-driven engineering, the model of computation explains how the behaviour of the whole system is the result of the behaviour of each of its components."

Concurrency

From the Latin, concurrere, "run together"

Discussion: Is concurrency hard?

Web

Related phrases: concurrency control wrongway concurrency wrong way concurrency optimistic concurrency control optimistic concurrency java concurrency p2c/c2p concurrency non lock concurrency control non concurrency

Definitions of Concurrency on the Web:

- concurrence: agreement of results or opinions
- concurrence: acting together, as agents or circumstances or events wordnet.princeton.edu/perl/webwn
- In computer science, concurrency is a property of systems in which several computational
 processes are executing at the same time, and potentially interacting with each other. ...
 en.wikipedia.org/wiki/Concurrency (computer science)
- A concurrency, overlap, or coincidence in a road network is an instance of one physical road bearing two or more different highway, motorway, or other route numbers. When it is two freeways that share the same right-of-way, it is sometimes called a common section or commons. en.wikipedia.org/wiki/Concurrency (road)
- The property or an instance of being concurrent; something that happens at the same time as something else
- en.wiktionary.org/wiki/concurrency
- Execution of two processes or operations simultaneously. www.iso.port.ac.uk/~mike/interests/chistory/documents/cpm-22-manual/axh.html

1: 10

Potential Confusion

- · Concurrent vs. parallel
- Concurrent vs. nondeterminate

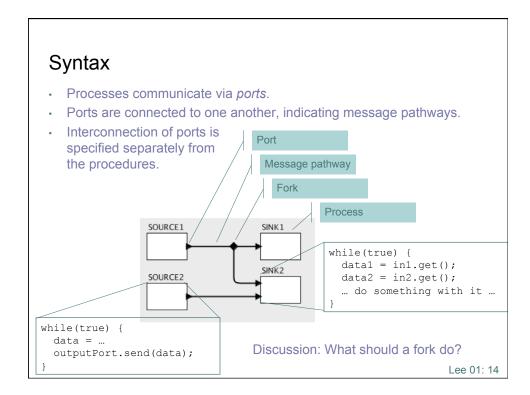

Lee 01: 11

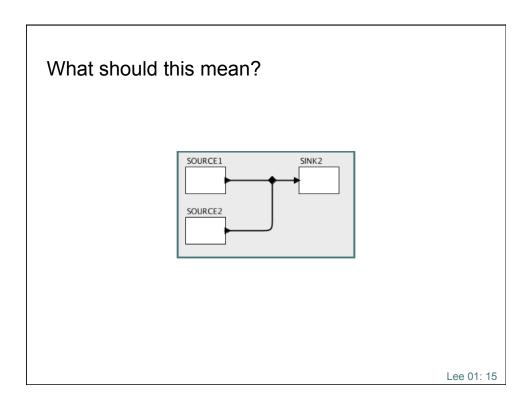

Kahn Process Networks (PN) A Concurrent Model of Computation (MoC)

- · A set of components called actors.
- Each representing a sequential procedure.
- Where steps in these procedures receive or send messages to other actors (or perform local operations).
- Messages are communicated asynchronously with unbounded buffers.
- A procedure can always send a message. It does not need to wait for the recipient to be ready to receive.
- Messages are delivered reliably and in order.
- When a procedure attempts to receive a message, that attempt blocks the procedure until a message is available.

Coarse History

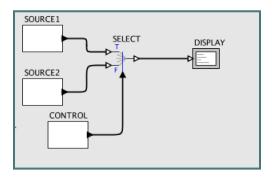

- Semantics given by Gilles Kahn in 1974.
 - Fixed points of continuous and monotonic functions
- More limited form given by Kahn and MacQueen in 1977.
 - Blocking reads and nonblocking writes.
- o Generalizations to nondeterministic systems
 - Kosinski [1978], Stark [1980s], ...
- Bounded memory execution given by Parks in 1995.
 - Solves an undecidable problem.
- o Debate over validity of this policy. Geilen and Basten 2003.
 - Relationship between denotational and operational semantics.
- Many related models intertwined.
 - Actors (Hewitt, Agha), CSP (Hoare), CCS (Milner), Interaction (Wegner), Streams (Broy, ...), Dataflow (Dennis, Arvind, ...)...

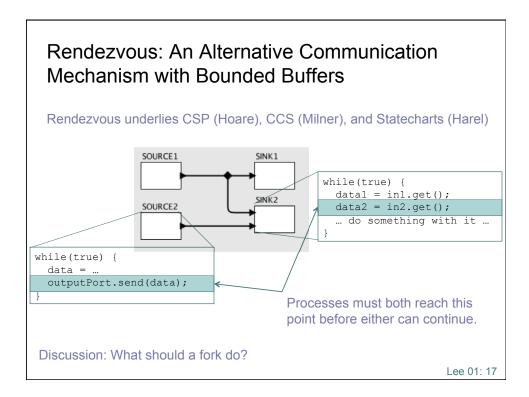

Question 1: Is "Fair" Thread Scheduling a Good Idea?

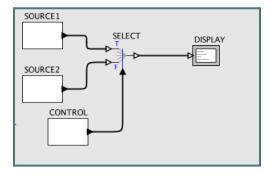

In the following model, what happens if every thread is given an equal opportunity to run?

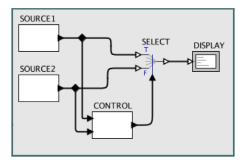

How does this program compare under rendezvous communication vs. process networks?

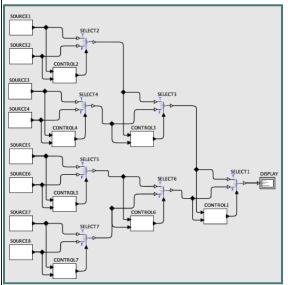

Question 2: Should we use Rendezvous Here?

The control signal now depends on the source data.

Lee 01: 19

A Practical Application with this Structure

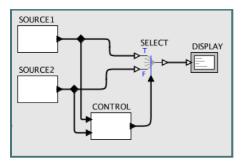

Consider collecting time-stamped trades from commodities markets around the world and merging them into a single time-stamped stream. The CONTROL actors could compare time stamps, with logic like this:

```
data1 = topPort.get();
data2 = bottomPort.get();
while (true) {
   if (data1.time < data2.time)) {
     output.send(true);
     data1 = topPort.get();
} else {
     output.send(false);
     data2 = bottomPort.get();
}</pre>
```

Question 3: How about Demand-Driven (Lazy) Execution?

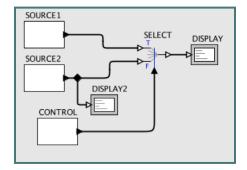

In demand-driven execution, a process is stalled unless its outputs are required by a downstream process.

The DISPLAY process has nothing downstream. When should it be allowed to run?

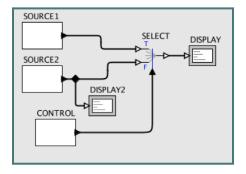

Lee 01: 21

Will Demand-Driven Execution Work Here?

Question 4: Will Data-Driven Execution Work?

In data-driven execution, a process is stalled unless it has input data. What about the processes with no inputs?

Lee 01: 23

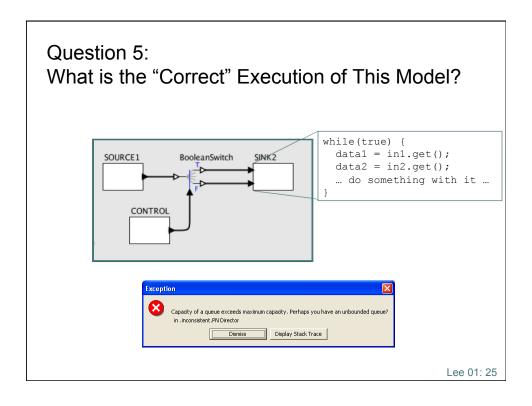

Things are not looking good...

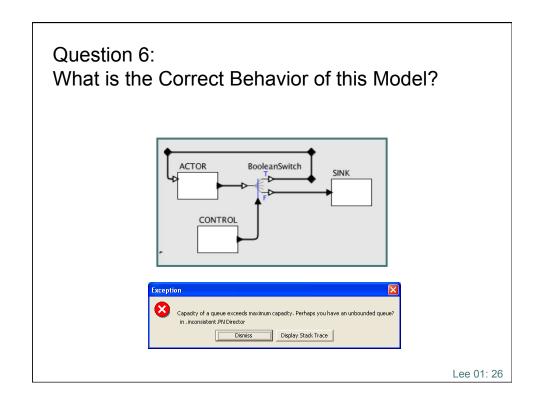

We have ruled out:

- Fair execution.
- · Rendezvous communication.
- Demand-driven execution.
- Data-driven execution.

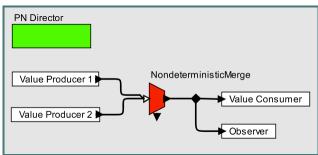

For all the examples given so far, there is an obvious execution policy that does what we want. Is there a general policy that will always deliver that obvious policy?

Are there models for which the policy is not so obvious?

Question 7: How to support nondeterminism?

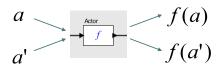

Merging of streams is needed for some applications. Does this require fairness? What does fairness mean?

Lee 01: 27

Properties of PN (Two Big Topics)

- Assuming "well-behaved" actors, a PN network is determinate in that the sequence of tokens on each arc is independent of the thread scheduling strategy.
 - Making this statement precise, however, is nontrivial.
- PN is Turing complete.
 - Given only boolean tokens, memoryless functional actors, Switch, Select, and initial tokens, one can implement a universal Turing machine.
 - Whether a PN network deadlocks is undecidable.
 - Whether buffers grow without bound is undecidable.

PN Semantics Where This is Going

A signal is a sequence of values Define a prefix order:

$$a \sqsubseteq a'$$

means that a is a prefix of a'.

Actors are *monotonic* functions:

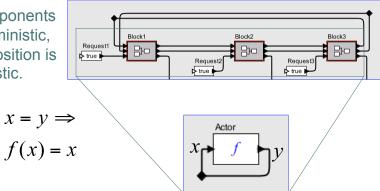

$$a \sqsubseteq a' \Rightarrow f(a) \sqsubseteq f(a')$$

Stronger condition: Actors are *continuous* functions (intuitively: they don't wait forever to produce outputs).

Lee 01: 29

PN Semantics of Composition (Kahn, '74) This Approach to Semantics is "Tarskian"

If the components are deterministic, the composition is deterministic.

Fixed point theorem:

- · Continuous function has a unique least fixed point
- Execution procedure for finding that fixed point
- Successive approximations to the fixed point

What is Order?

Intuition:

- 1. 0 < 1
- 2. 1 < ∞
- 3. child < parent
- 4. child > parent
- 5. 11,000/3,501 is a better approximation to π than 22/7
- 6. integer n is a divisor of integer m.
- 7. Set A is a subset of set B.

Which of these are partial orders?

Lee 01: 31

Relations

- A relation R from A to B is a subset of $A \times B$
- o A function F from A to B is a relation where $(a, b) \in R$ and $(a, b') \in R \Rightarrow b = b'$
- A binary relation R on A is a subset of $A \times A$
- o A binary relation R on A is reflexive if $\forall a \in A, (a, a) \in R$
- A binary relation R on A is symmetric if $(a,b) \in R \Rightarrow (b,a) \in R$
- o A binary relation R on A is antisymmetric if $(a, b) \in R$ and $(b, a) \in R \Rightarrow a = b$
- o A binary relation R on A is transitive if $(a, b) \in R$ and $(b, c) \in R \Rightarrow (a, c) \in R$

Infix Notation for Binary Relations

- \circ $(a, b) \in R$ can be written a R b
- A symbol can be used instead of *R*. For examples:
 - $\bullet \le \subset N \times N$ is a relation.
 - $(a, b) \in \leq$ is written $a \leq b$
- o A function f ∈ (A, B) can be written $f : A \rightarrow B$

Lee 01: 33

Partial Orders

A partial order on the set A is a binary relation \leq that is: For all $a, b, c \in A$,

- o reflexive: $a \le a$
- o antisymmetric: $a \le b$ and $b \le a \Rightarrow a = b$
- transitive: $a \le b$ and $b \le c \Rightarrow a \le c$

A partially ordered set (poset) is a set A and a binary relation \leq , written (A, \leq) .

Strict Partial Order

For every partial order \leq there is a *strict partial order* \leq where $a \leq b$ if and only if $a \leq b$ and $a \neq b$.

A *strict poset* is a set and a strict partial order.

Lee 01: 35

Total Orders

Elements a and b of a poset (A, \leq) are *comparable* if either $a \leq b$ or $b \leq a$. Otherwise they are *incomparable*.

A poset (A, \leq) is *totally ordered* if every pair of elements is comparable.

Totally ordered sets are also called *linearly ordered sets* or *chains*.

Quiz

- 1. Is the set of integers with the usual numerical ordering a well-ordered set? (A *well-ordered set* is a set where every non-empty subset has a least element.)
- 2. Given a set A and its *powerset* (set of all subsets) P(A), is $(P(A), \subseteq)$ a poset? A chain?
- 3. For $A = \{a, b, c\}$ (a set of three letters), find a well-ordered subset of $(P(A), \subseteq)$.

Lee 01: 37

Answers

- 1. Is the set of integers with the usual numerical ordering a well-ordered set?

 No. The set itself is a chain with no least element.
- 2. Given a set A and its *powerset* (set of all subsets) P(A), is $(P(A), \subseteq)$ a poset? A chain? It is a poset, but not a chain.
- 3. For $A = \{a, b, c\}$ (a set of three letters), find a well-ordered subset of $(P(A), \subseteq)$.

 One possibility: $\{\emptyset, \{a\}, \{a, b\}, \{a, b, c\}\}$

Pertinent Example: Prefix Orders

Let T be a type (a set of values).

Let T^{**} be the set of all finite and infinite sequences of elements of T, including the empty sequence \bot (bottom).

Let \sqsubseteq be a binary relation on T^{**} such that $a \sqsubseteq b$ if a is a *prefix* of b. That is, for all n in N such that a(n) is defined, then b(n) is defined and a(n) = b(n).

This is called a *prefix order*.

During execution, the outputs of a PN actor form a well-ordered subset of (T^{**}, \sqsubseteq) .

Lee 01: 39

Summary

- Concurrent models of computation
- o Process networks as an example
- o Intuitive model, but many subtle corner cases
- Need a solid theory underlying it
- Posets
- o Next time:
 - give meaning to all programs
 - develop an execution policy
