

# Glossary

- abstract syntax** ..... A conceptual data organization. cf. *concrete syntax*.
- action methods** ..... The methods `initialize()`, `prefire()`, `fire()`, `postfire()`, and `wrapup()` in the Executable interface.
- actor** ..... An executable entity. This was called a *block* in Ptolemy Classic.
- anytype** ..... The Ptolemy Classic name for *undeclared type*.
- applet** ..... A Java program that is downloaded from a web server by a browser and executed in the client's computer (usually within a plug-in for the browser). An applet has restricted access to local resources for security reasons. cf. application.
- application** ..... A Java program that is executed as an ordinary program on a host computer. Unlike an applet, an application can have full access to local resources such as the file system. cf. applet.
- atomic actor** ..... A primitive actor. That is, one that is not a composite actor. This was called a *star* in Ptolemy Classic.
- attribute** ..... A named property associated with a named object in Ptolemy II. Also, in XML, a modifier to an element.
- block** ..... The Ptolemy Classic name for an *actor*.
- browser** ..... A program that renders HTML and accesses the worldwide web using the HTTP protocol.
- channel** ..... A path from an output port to an input port (via relations) that can transport a single stream of tokens.
- clustered graph** ..... A graph with hierarchy. Ptolemy II topologies are clustered graphs.
- code generation** ..... Translation of a model into efficient, standalone software for execution autonomously from the design environment. Code generation was a major emphasis of Ptolemy Classic.
- composite actor** ..... An actor that is internally composed of other actors and relations. This was called a *galaxy* in Ptolemy Classic.
- concrete syntax** ..... A persistent representation of a data organization. cf. *abstract syntax*.
- connection** ..... A path from one port to another via relations and possibly transparent ports. A connection consists of one or more *relations* and two or more *links*.
- container** ..... An object that logically owns another. A Ptolemy II object can have at most one container.
- dangling relation** ..... A relation with only input ports or only output ports linked to it.
- data polymorphism** ..... Ability to operate with more than one token type.
- deep traversals** ..... Traversals of a clustered graph that see through transparent cluster boundaries (transparent composite entities and ports).

---

<b>disconnected port</b> .....	A port with no relation linked to it.
<b>director</b> .....	An object that controls the execution of a model or an opaque composite entity according to some <i>model of computation</i> .
<b>domain</b> .....	An implementation of a model of computation in Ptolemy II and Ptolemy Classic.
<b>domain polymorphism</b> .....	Ability to operate under more than one model of computation.
<b>element</b> .....	In XML, a portion of a document consisting of a begin tag, a body, and an end tag.
<b>entity</b> .....	A node in a Ptolemy II clustered graph. Also, in XML, a named text segment.
<b>event</b> .....	In the DE domain, an event is a token with a time stamp.
<b>execution</b> .....	One invocation of initialize(), followed by any number of <i>iterations</i> , followed by one invocation of wrapup().
<b>executive director</b> .....	From the perspective of an actor inside an opaque composite actor, the director of the container of the opaque composite actor.
<b>galaxy</b> .....	The Ptolemy Classic name for a <i>composite actor</i> .
<b>immutable property</b> .....	A property of an object that is set up when the object is constructed and that cannot be changed during the lifetime of the object.
<b>iteration</b> .....	One invocation of prefire(), followed by any number of invocations of fire(), followed by one invocation of postfire().
<b>link</b> .....	An association between a port and a relation.
<b>manager</b> .....	The top-level controller for the execution of a model.
<b>model</b> .....	A complete Ptolemy II application. This was called a <i>universe</i> in Ptolemy Classic.
<b>model of computation</b> .....	The rules that govern the interaction, communication, and control flow of a set of components.
<b>MoML</b> .....	Modeling markup language, an XML dialect for specifying component-based designs such those in Ptolemy II.
<b>multiport</b> .....	A port that can send or receive tokens over more than one channel.
<b>opaque</b> .....	For a composite entity or a port, an attribute that indicates that the inside should not be visible from the outside. That is, deep traversals of the topology do not see through an opaque boundary.
<b>opaque composite actor</b> .....	A composite actor with a local director. Such an actor appears to the outside domain to be atomic, but internally is composed of an interconnection of other actors. This was called a <i>wormhole</i> in Ptolemy Classic.
<b>package</b> .....	A collection of classes that forms a logical unit and occupies one directory in the source code tree.
<b>parameter</b> .....	An <i>attribute</i> with a value. This was called a <i>state</i> in Ptolemy Classic.
<b>particle</b> .....	The Ptolemy Classic name for a <i>token</i> .
<b>port</b> .....	A named interface of an entity to which connections be made.
<b>Ptolemy Classic</b> .....	A C++ software system for construction of concurrent models and implementation through code generation.

---

<b>Ptolemy II</b> .....	A Java software system for construction and execution of concurrent models.
<b>Ptolemy Project</b> .....	A research project at Berkeley that investigates modeling, simulation, and design of concurrent, networked, embedded systems.
<b>relation</b> .....	An object representing an interconnection between entities.
<b>resolved type</b> .....	A type for a port that is consistent with the type constraints of the actor and any port it is connected to. It is the result of type resolution.
<b>servlet</b> .....	A Java program that is executed on a web server and that produces results viewed remotely on a web browser.
<b>star</b> .....	The Ptolemy Classic name for an <i>atomic actor</i> .
<b>state</b> .....	The Ptolemy Classic name for a <i>parameter</i> .
<b>subpackage</b> .....	A package that is logically related to a parent package and occupies a subdirectory within the parent package in the source code tree.
<b>tag</b> .....	In XML, a portion of markup having the syntax <code>&lt;tagname&gt;</code> .
<b>token</b> .....	A unit of data that is communicated by actors. This was called a <i>particle</i> in Ptolemy Classic.
<b>topology</b> .....	The structure of interconnections between entities (via relations) in a Ptolemy II model. See <i>clustered graph</i> .
<b>transparent</b> .....	For an entity or port, not opaque. That is, deep traversals of the topology pass right through its boundaries.
<b>transparent composite actor</b>	A composite actor with no local director.
<b>transparent port</b> .....	The port of a transparent composite entity. Deep traversals of the topology see right through such a port.
<b>type constraints</b> .....	The declared constraints on the token types that an actor can work with.
<b>type resolution</b> .....	The process of reconciling type constraints prior to running a model.
<b>undeclared type</b> .....	Capable of working with any type of token. This was called <i>anytype</i> in Ptolemy Classic.
<b>universe</b> .....	The Ptolemy Classic name for a <i>model</i> .
<b>width of a port</b> .....	The sum of the widths of the relations linked to it, or zero if there are none.
<b>width of a relation</b> .....	The number of channels supported by the relation.
<b>wormhole</b> .....	The Ptolemy Classic name for an <i>opaque composite actor</i> .
